Application Mission Pack - North America Central Product Research Testing Panelist Payments

Operational support knowledge | version 1 | evidence-limited baseline

SOURCE_INCOMPLETE - do not treat this package as a fully grounded support manual

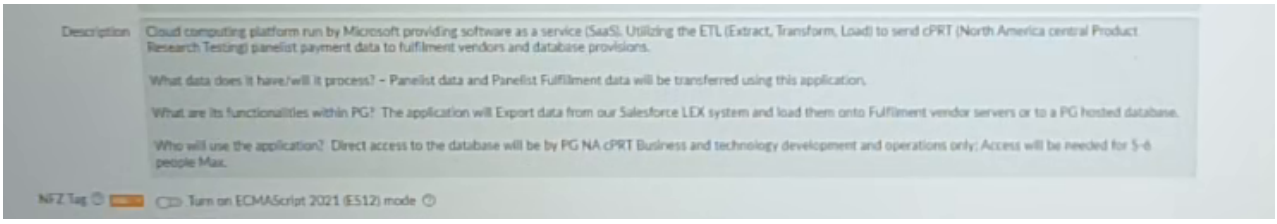

Executive Brief

Session 41 provides limited business/lifecycle context and a captured application-catalogue description. It does not provide the promised technical walkthrough. [C-016, C-019, C-024]

The catalogue screen suggests an ETL path for panelist-payment and fulfilment data; validate the source and destinations with the technical owner before operating it. [C-016, C-017]

Application Catalogue Evidence

Source frame V-004; OCR and visual review support the limited catalogue details included above. Exact owner and application ID are intentionally omitted because they are not legible enough.

Source frame V-004; exact timestamp in evidence-timeline.json.

Business Purpose

The application is named North America Central Product Research Testing Panelist Payments. Its record describes panelist data and fulfilment data being transferred, and Salesforce LEX exports loaded to fulfilment vendor servers or a P&G-hosted database. These details are from the captured catalogue screen, not a completed technical walkthrough. [C-001, C-016, C-017]

Support Scope

The catalogue lists P&G AMS Support Team; it describes direct database access for PG NA CPRT business, technology development, and operations, with about five to six people at most. [C-018]

Support boundary across SaaS provider, ETL, vendor servers, and P&G-hosted database is not fully established. [C-016, C-017]

Users and Roles

The catalogue description identifies PG NA CPRT business, technology development, and operations as direct database users; access expected for five to six people at most. [C-018]

The recording does not name individual approvers or provide a role matrix. [C-018]

Operational Data Flow

Captured record: Salesforce LEX data is exported and loaded to fulfilment vendor servers or a P&G-hosted database; panelist and fulfilment data are transferred using the application. [C-016, C-017]

No file formats, schedules, validation rules, retry/error paths, reconciliation, or manual operation steps are described. [C-017]

Technical Architecture

The captured catalogue description calls this a Microsoft-run cloud/SaaS platform using ETL. No specific Microsoft service, Azure subscription/resource, environment, network boundary, database engine, or integration implementation is confirmed. [C-016, C-017]

The speaker says code/scripts are stored in a location transcribed as 'data floor'; its exact name and URL/repository are unverified. [C-022]

Access and Authentication

A presenter reports lacking permission to the Azure resource group. A participant says to try an AMS Admin identity; the recording does not show whether that worked. [C-023]

The catalogue says direct database access is limited to named business/technology/operations functions and approximately five to six people. No credential or identity provider is stated. [C-018]

Ownership and Contacts

P&G AMS Support Team appears in the catalogue screenshot. The individual owner field is too soft to transcribe reliably and is omitted. Business and technical owners are not confirmed. [C-018, V-004]

Application Lifecycle

The speaker reports a move from sunset to leverage optimized because decommissioning had not been decided. The captured record displays Leverage/Optimize. [C-019]

Limited usage is based on ticket history; limited users are described as the speaker's impression. Possible future decommissioning is expected, not approved. [C-020, C-021]

Source frame V-005; exact timestamp in evidence-timeline.json.

Support Operations

The application is associated with limited ticket usage and possible future decommission requests. The recording gives no ticket queue, on-call model, monitoring, reconciliation, support schedule, or recurring operator checklist. [C-020, C-021]

Troubleshooting Knowledge

Observed access issue: presenter lacked Azure resource-group permission. The suggested AMS Admin identity was not shown to resolve it. No validated resolution path is available. [C-023]

Procedures / SOP

No operational procedure is supported. Do not turn the access attempt or unverified ETL description into runbook steps. [C-017, C-023, C-024]

Known Risks and Limitations

Lifecycle decision remains undecided; low usage/user claims are partly impression-based; source ends before the video; the ETL description is only a captured catalogue record. [C-019, C-020, E-024]

The phrase 'transition to corruption mining' is suspicious and unresolved. Do not publish it as a lifecycle activity. [C-025]

Deferred / Missing Knowledge

Verified service/repository name, code location, access group, actual architecture, ETL jobs, source/target schemas, vendor list, monitoring, failure handling, ownership, ticket statistics, lifecycle decision, and technical walkthrough are missing. [C-022, C-023, C-024]

Open Questions

What is the verified platform/repository name transcribed as 'data floor', and where are its scripts/code?

Which Azure resource group and approved AMS Admin role are required, and who grants them?

Which Microsoft SaaS/ETL service is used, and what are its environments and operating owner?

Confirm the Salesforce LEX extract, panelist/fulfilment data fields, destinations, schedules, and failure handling shown in the catalogue record.

Confirm which fulfillment vendors and P&G-hosted databases are current destinations.

Who are the application, business, technical, support, and decommissioning decision owners?

What ticket counts, user counts, operational load, and last-use evidence support the lifecycle decision?

Is decommissioning planned, approved, funded, or only a possible future request?

What did 'transition to corruption mining' mean? No interpretation is supported by this recording.

What exact technical session and application-access demonstration were deferred?

Which named individuals should be contacted? The screenshot owner text is too soft to record reliably.

Action Items / Follow-ups

Schedule the deferred technical walkthrough; arrange approved resource-group access and confirm the correct AMS Admin role through the normal access process. [C-023, C-024]

Locate and verify the code/scripts repository, dataflows, destinations, ticket/user evidence, and lifecycle decision owner. [C-017, C-020, C-021, C-022]

Ask the speaker to clarify 'transition to corruption mining'; do not guess its meaning. [C-025]

Ambiguities / Needs Review

'Data floor' could not be verified as a platform/repository name. No interpretation is supported. [C-022]

'Transition to corruption mining' has no supported interpretation in the source. [C-025]

Glossary

ETL: Extract, Transform, Load; this expansion appears in the captured application-catalogue description. [C-016]

SaaS: software as a service; this expansion appears in the captured application-catalogue description. [C-016]

'Data floor' is not included as a verified glossary term. [C-022]
