Application Mission Pack - pgregdoc.com

Operational support knowledge | version 1 | evidence-limited baseline

SOURCE_INCOMPLETE - do not treat this package as a fully grounded support manual

Executive Brief

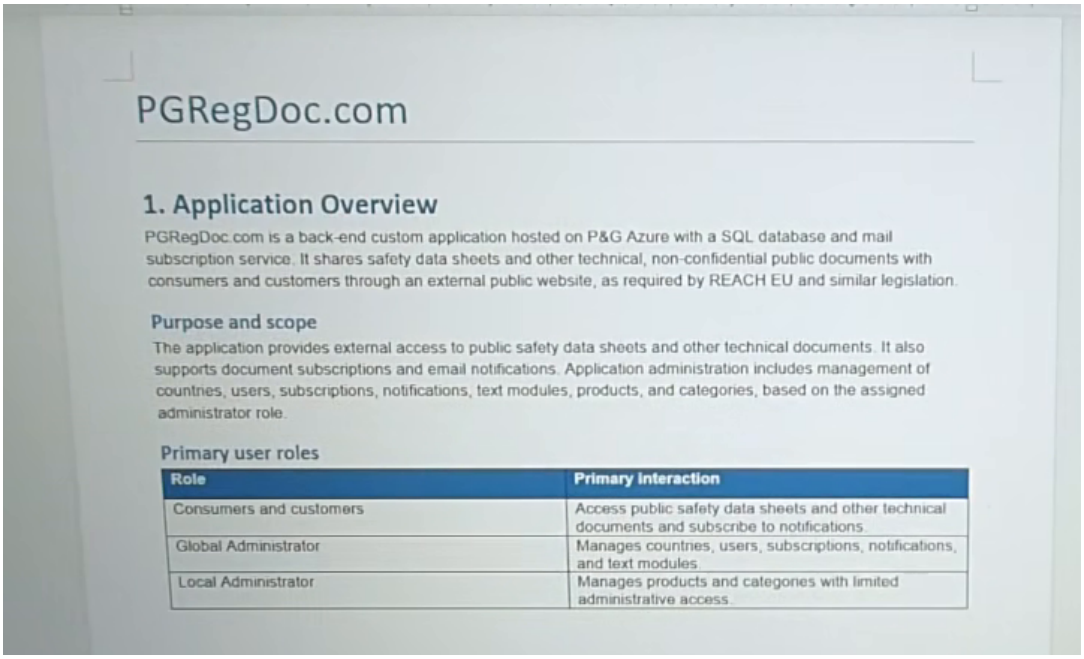

PG RegDoc is described as a custom backend supporting a public document portal for safety data sheets (SDS) and other non-confidential technical documents. [C-002, C-003]

This session covers its business overview but not the promised technical deep-dive. Treat architecture and access details as a starting evidence set, not an operational runbook. [C-011, C-015]

Business Purpose

Provide external access to public SDS and technical documents for customers/consumers; subscriptions and email updates are also described. [C-003, C-006]

REACH is mentioned as a related business requirement. The speaker explicitly disclaims familiarity with REACH; the informal 'regulations' gloss is not a verified definition. [C-004, C-005]

PGRegDoc.com

1. Application Overview

PGRegDoc.com is a back-end custom application hosted on P&G Azure with a SQL database and mail subscription service. It shares safety data sheets and other technical, non-confidential public documents with consumers and customers through an external public website, as required by REACH EU and similar legislation.

Purpose and scope

The application provides external access to public safety data sheets and other technical documents. It also supports document subscriptions and email notifications. Application administration includes management of countries, users, subscriptions, notifications, text modules, products, and categories, based on the assigned administrator role.

Primary user roles

Role	Primary interaction
Consumers and customers	Access public safety data sheets and other technical documents and subscribe to notifications.
Global Administrator	Manages countries, users, subscriptions, notifications, and text modules.
Local Administrator	Manages products and categories with limited administrative access.

Source frame V-001; exact timestamp in evidence-timeline.json.

Support Scope

In scope: support for the public website because the team supports the backend application that serves it. [C-008]

Frontend ownership, external site infrastructure, and explicit out-of-scope components are not specified. Do not infer a separate frontend team or exclusion. [C-008]

Users and Roles

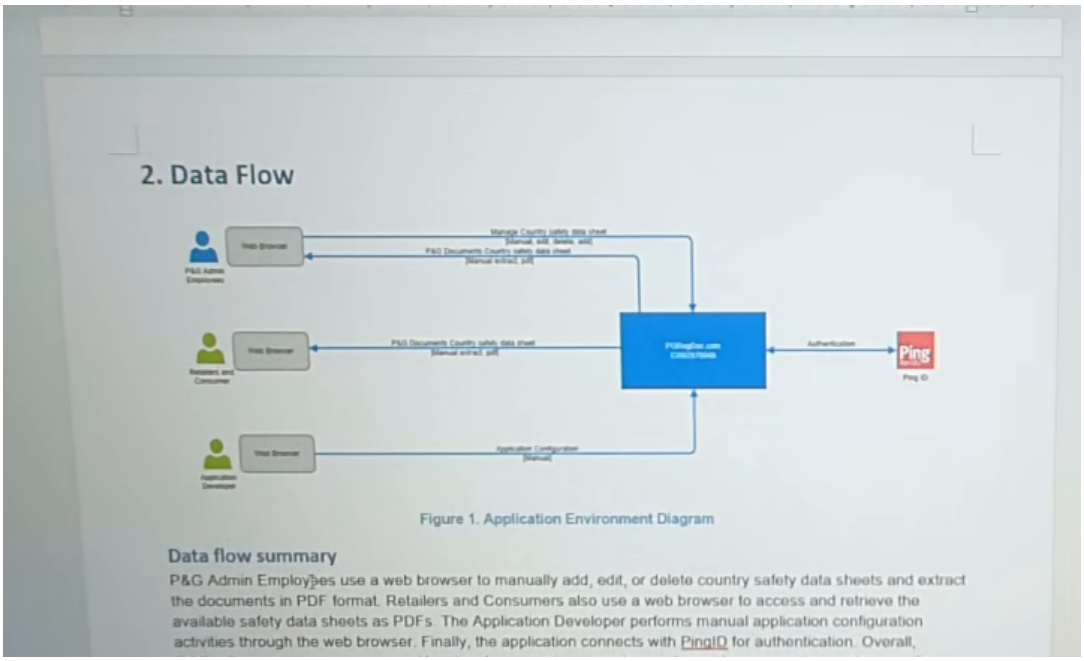

Consumers/customers access public documents and subscribe to notifications. Global administrators manage countries, subscriptions, notifications/text modules; local administrators manage products/categories. [C-006, C-007]

Administrative capabilities depend on the assigned role. [C-007]

Operational Data Flow

Admin employees manually add, edit, and delete country-specific SDS and extract documents as PDF. Consumers retrieve available SDS PDFs through a browser. Developers use the application for manual configuration. [C-009, C-010]

The transcript does not define the email delivery path or where subscription state is stored. [C-002, C-006]

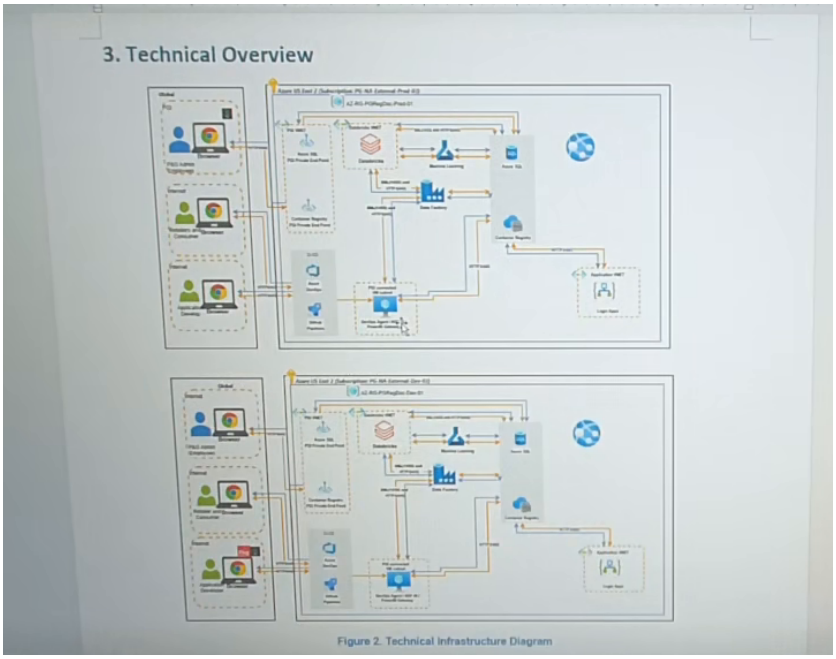

Source frame V-002; exact timestamp in evidence-timeline.json.

Technical Architecture

Evidence names P&G Azure, separate production/development environments, SQL/Azure SQL storage, Azure Data Factory processing, private endpoints, and virtual networks. [C-002, C-011]

The slide shows a technical infrastructure diagram, but component labels and detailed flows are not readable enough to establish specific service instances, topology, deployment pipeline, or network rules. [V-003]

The mail subscription service is named but its implementation and relationship to SQL/Data Factory are unresolved. [C-002]

Source frame V-003; exact timestamp in evidence-timeline.json.

Access and Authentication

Public consumer access and role-based administrator access are described; users are said to be managed through IT Access. [C-007, C-013]

The flow diagram labels PingID; transcript exports render the spoken provider phrase differently. Confirm the current identity configuration before operational use. [C-013]

Ownership and Contacts

The reference overview names Miguel Angel Moreno-Fernandez as owner; this is evidenced in the transcript and slide. [C-012]

A presenter called Muchun was expected to provide technical detail but said they were not prepared and lacked access. This does not establish technical ownership. [C-015]

Application Lifecycle

No lifecycle status, decommissioning plan, or lifecycle decision is established for PG RegDoc in this recording. [E-009, E-012]

A speaker says the app is not fully developed and begins an 'open source' statement, but the sentence is incomplete and needs clarification. [C-014]

Support Operations

Recurring evidenced work is manual country-specific SDS maintenance, role-based product/category/country administration, subscription/notification administration, PDF extraction, and manual developer configuration. [C-006, C-007, C-009, C-010]

No monitoring, incident intake, patching cadence, release, restore, or ticket procedures are evidenced. [E-009, E-012]

Troubleshooting Knowledge

No application symptoms, diagnostic checks, or validated resolutions were demonstrated. The planned technical session was deferred. [C-015]

Do not infer troubleshooting steps from the architecture slide. [V-003]

Procedures / SOP

No step-by-step support SOP is sufficiently evidenced. The transcript describes business activities, not an approved operational procedure. [C-009, C-010]

Known Risks and Limitations

The recording is source-incomplete, ending 11m09s before video end; unrecorded technical detail may exist. [E-024]

Technical deep-dive, mail integration, authentication provider, precise website support boundary, and application maturity remain unresolved. [C-008, C-013, C-014, C-015]

Deferred / Missing Knowledge

Detailed architecture, app components, Azure resource names, SQL model, Data Factory pipelines, private endpoint/VNet routes, monitoring, backup/restore, change/release, identity groups, support escalation, code location, and dependency ownership are missing. [V-003, C-015]

Open Questions

Which technical owner can provide the deferred architecture walkthrough and source/code ownership?

Where does the mail subscription service run, and what triggers and sends email updates?

Does Azure SQL initiate notifications, or is another service responsible?

Which Azure resources, subscriptions, regions, deployment units, and production/development URLs are in scope?

Which SQL databases/schemas and Data Factory pipelines are used, and what schedules/retries/alerts apply?

Which private endpoints, VNets, DNS, firewall rules, and identity controls apply?

What is the exact identity provider name? The transcript variants conflict ('being'/'spin solutions').

Which IT Access group grants consumer, global-admin, local-admin, and developer permissions?

What is the precise support boundary for the public frontend, backend, and external website?

What are backup, restore, retention, monitoring, incident escalation, and change procedures?

Is the application still under development, and what did the incomplete 'open source' statement mean?

Which version of the app reference/classification/BIA record is current?

Action Items / Follow-ups

Schedule the deferred technical walkthrough with the application technical owner; confirm the presenter has approved access before the session. [C-015]

Validate mail/notification implementation, authentication provider, IT Access groups, support boundary, and current classification/BIA record. [C-002, C-012, C-013]

Ambiguities / Needs Review

REACH definition is explicitly uncertain; preserve that as speaker uncertainty. [C-005]

Resolve the authentication phrase conflict and the incomplete development/open-source statement. [C-013, C-014]

Glossary

SDS: safety data sheet. [C-003, C-009]

Azure Data Factory: named in the source as supporting data processing. [C-011]

Production and development: the two environments named in the source. [C-011]

REACH is excluded as an unverified definition; the flow diagram labels PingID, while the spoken provider phrase remains ambiguous. [C-005, C-013]
